Criteria —

Ficedula hypoleuca is a widespread summer visitor to much of Europe (occurring more patchily in the south and west), with the region constituting >75% of its global breeding range. Its European breeding population is extremely large (>12,000,000 pairs), and was stable between 1970–1990. Although the species declined in several countries during 1990–2000—most notably in Fennoscandia—the stronghold population in Russia and other eastern populations were stable, and the species declined only slightly overall. Consequently, it is evaluated as Secure.
