Locustella luscinioides has a widespread but patchy breeding distribution in Europe, which constitutes >50% of its global breeding range. Its European breeding population is large (>530,000 pairs), and was stable between 1970–1990. Although there were declines in some marginal populations during 1990–2000, key populations in the core of the breeding range—notably in Romania—were stable, and the species probably remained stable overall. Consequently, the species is provisionally evaluated as Secure.
